Our Wuxi company has great location about 100km away from Shanghai Port, in which just 30 minutes away from Shanghai by train and one hour by car.

Rapid Scaffolding takes pride in having a team of highly experienced and suitably qualified engineering and technical experts. According to different requests from our clients, we can provide a whole range of scaffolding and formwork designing. We provide one-stop service for any project.

We have a highly experienced production team, which maintains top level of every stage of the production progress. Each team of workers is led by a supervisor who monitors daily works. Automated welding and robot welding systems are widely used.

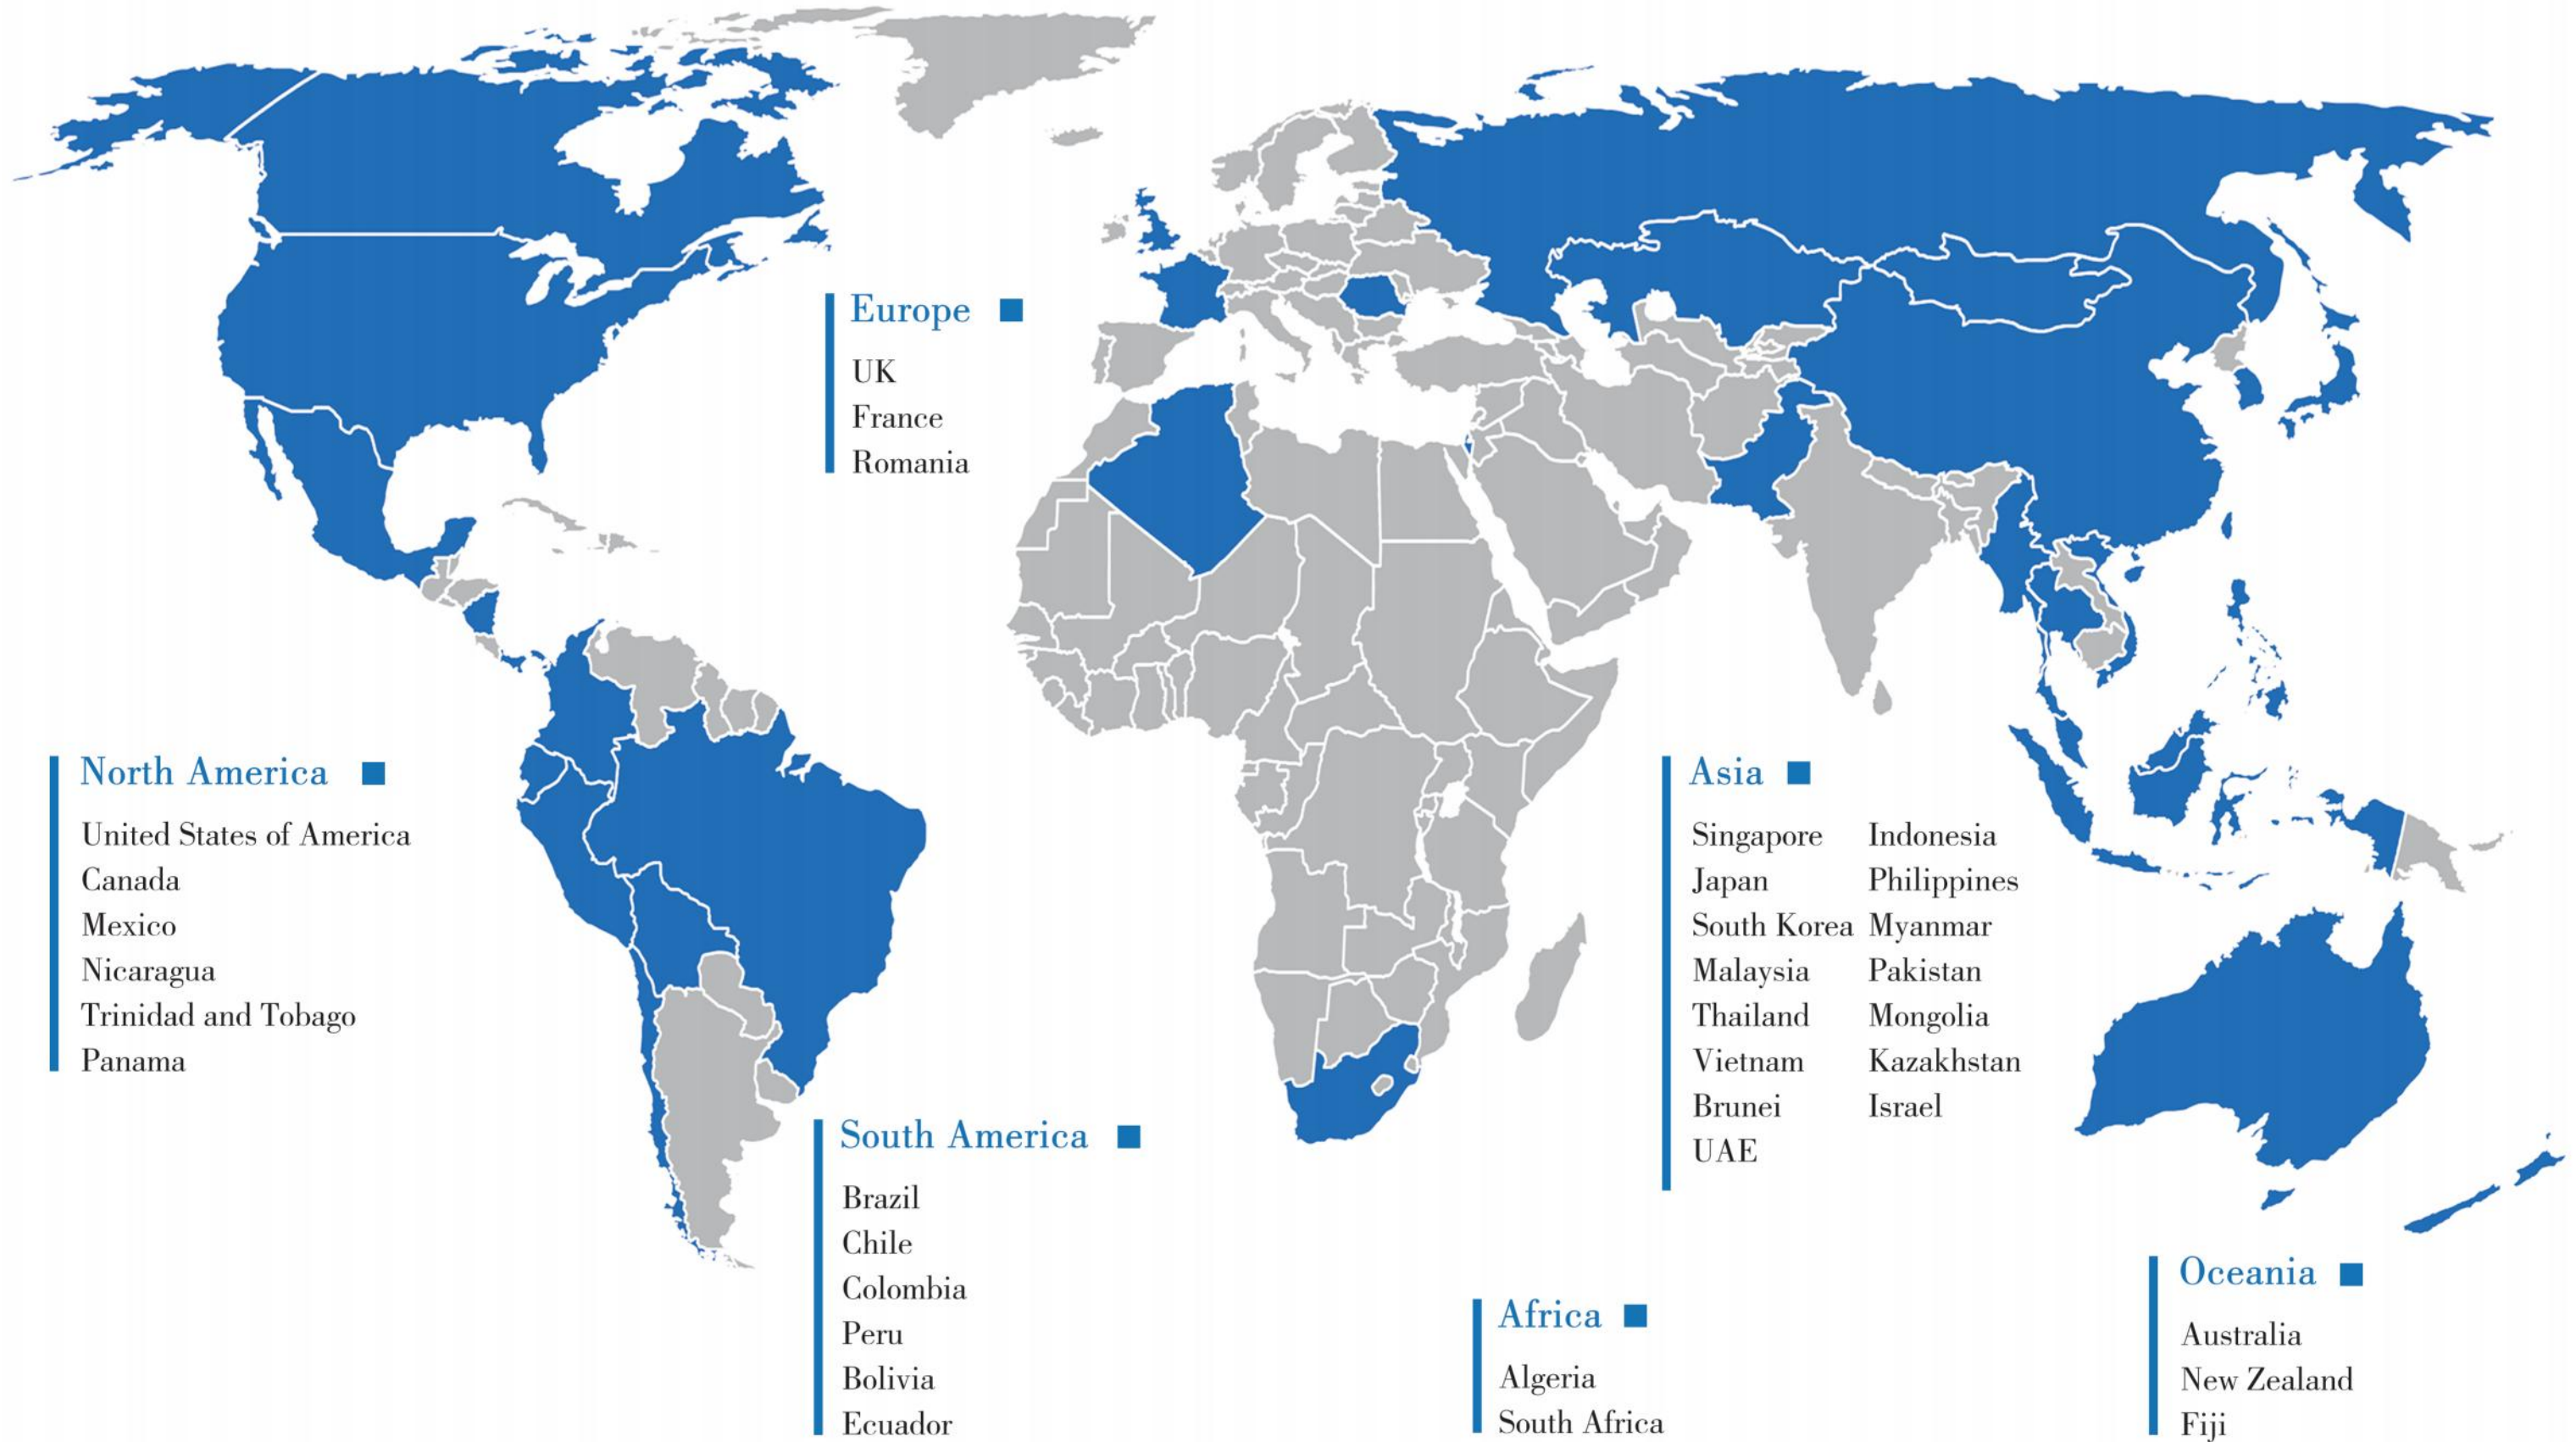

We have a complete quality control system, which guarantees the high quality of our products and assure all process is due to schedule. Rapid has obtained ISO9001, EN-1090, ISO14001, OHSAS18001 and our products have various certificates such as EN-12811, EN1004,AS/NZS1576.2, MS1462, JIS, CIDB etc.

RAPID FORMWORK & SCAFFOLDING CO.,LTD.

Rapid Formwork & Scaffolding Co.,Ltd. is a leading company in scaffolding industry in China. Since its establishment in 2004,Rapid has grown to take on new challenges and its continued success comes from valuing its clients and employees and a commitment to service, performance and quality. We are not only the expert in designing and manufacturing all kinds of steel scaffoldings and formwork system, but also we devote to being an expert in developing aluminum scaffoldings.Our main products include Ringlock (Allround),Octagonlock,Cuplock,Kwikstage,Haky,Frames,Props,etc.

Rapid has 2 production bases in Wuxi and Tangshan, with a total area of about 80,000m² and a total annual production capacity of about 75,000T. We have 3 branches in Singapore,Malaysia,UAE, Rapid products are mainly sold to 89 countries including USA,Canada, Germany, UK, Singapore, Malaysia, Japan, Thailand, Australia and New Zealand.

Formwork System

Timber-Beam Formwork

01 Timber Beam H20—cost-effective formwork girder

Wings :Spruce Wood(from Finland)
 Web: Cottonwood Plywood
 Glue: HENKEL Glue

Capacity

Standardized production lines.
 Supply capability: 3000m/day
 Lmax=6600mm.

Characteristics

Finger jointing of the flange and web, the strength of timber beam is highly improved.
 Max. shearing force failure load:40KN
 Well treated to prevent from water penetration or erosion, so the service life maximally extended.
 Robust caps at the end of the girders protect against damages.

02 Plywood—make perfect concrete surface

WISA-Form Birch is a coated special plywood using in the formwork systems where high requirements are set on the concrete surface and the times of reuses.
 WISA-Form Birch.

Specification: T=18mm& T=21mm
 In standard thickness,
 Moisture content 10 ± 2%

Formwork System

03 Formwork

With timber beam & WISA plywood, the formwork is low weight but high load capacity, it is widely used in construction.

Characteristics

Component with high standardization. Assembling in site, flexible application. Light weight, easy transportation and storage.

Flat Formwork

Formwork System

Formwork System

Adjustable Arced Formwork

► For pouring arced wall or column with radius more than 1m.

► Characteristics

Adjustable radius, flexible application.

Formwork System

Table Formwork

▶ Table formwork is the most typical application for slab, with timber beam, the slab formwork is light weight, fast and economic in the construction.

▶ Table Formwork Sketch

▶ Characteristics

Simple structure, easy assembly.

1 Arrange the table heads

2 Fix the main beams

3 Fix the second beams

4 Fix the plywood

▶ Flexible structure, be adapted to different support system.

For Prop

For Scaffolding

Formwork System

- ▶ Trolley for moving the table formwork on floor. Flexible application with stand alone props. Safer condition with handrails.

Height
 Standard device:
 Hmin=1750mm
 Hmax=3250mm
 Standard device
 with an attached frame:
 Hmin=2500mm
 Hmax=3900mm

Bearing load
 Standard device: 15~20KN
 Standard device
 with an attached frame: 11KN

Formwork System

Accessories

Name & Sketch	Weight	Tech. parameter	Remarks
 Lowering Head	3.45kg	L=328mm	For supporting timber beam
 U-Head	1.50kg	L=178mm	For supporting timber beam
 Straight Angle Jack	3.28kg 3.05kg	Φ61 L=160mm Φ50 L=160mm	For supporting timber beam

 Trolley	707.04kg		For shifting table formwork

Formwork System

Steel-Frame Formwork SF-120

02 Wall Formwork

01 Steel Frame

As the framework, it is adapted to the plywood with thickness of 18mm. High-precision production line guarantees the perfect products.

► Characteristics

Special hollow steel frame covered with WISA-plywood, light weight but high strength. Its allowable pressure is 60kN/m² with the weight of 65kG/m².

High standardized system

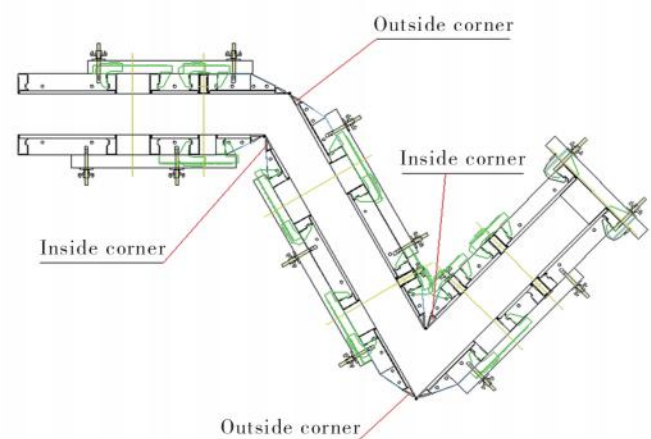

Formwork System

Easy connection with adjustable steel clamp

Convenient tie arrangement with the hole in frame

Articulated inside corner

Articulated outside corner

Convenient and fast corner formwork

Flexible to assemble and application

Formwork System

03 Column Formwork

► Characteristics

Allowable pressure is 80KN/m² . Faster and easy operation.
The dimension for column is adjustable.

Formwork System

Steel Formwork

Characteristics

- No assembling, easy operation with formed formwork.
- High stiffness, make perfect shape for concrete.
- Repeatedly turnover is available.
- Widely applied range, such as building, bridge, tunnel, etc.

Vertical Structure Support System

Single-Side Bracket

- ▶ During single-sided concreting, the concrete pressure is transferred into the sub-structure by means of the single-side bracket.

▶ Characteristics

For concrete heights up to 8.0m and a fresh concrete pressure up to a maximum of 60KN/m².
 Good standard performance and versatility.
 Fast element coupling, all units can be quickly connected.
 The finished wall is excellent and absolutely waterproof.
 Optimized sizes for transportation.

▶ Design Principle

There is no wall-through tie-rod in the single-side bracket system. The whole system is adjusted by the anchor system and the regulator system.
 The stress situation from the sketch above. F1 can resist the side pressure of the concrete and F2 can resist the rising force. R can not only bear the gravity force of the bracket, but also the side pressure of the concrete. This stress system is simple, reasonable and also with convenience and high safety.

Vertical Structure Support System

Single-side Climbing Formwork

Single-side climbing formwork have the similar structure. They are mainly used in the concrete pouring of dam, pier, and guy anchor, concrete protecting wall, tunnel, underground workshop and so on. Because the concrete lateral pressure is entirely supported by anchor system and bracket, the wall-through tie-rod and additional reinforcement are not needed. The construction is easy, rapid and economical; the concrete surface is smooth. They are perfect formwork system for single-side wall and large areas' concreting.

Vertical Structure Support System

► The assemble process (Take DP-180 as an example)

1. Install climbing bracket, fix upright for main platform.

2. Fix board for main platform.

3. Lift the brackets, hang them on the anchor shoes and insert the safe pins.

4. Connect pull-push props and vertical waling with the formwork system and install operation platform.

5. Lift the whole formwork.

► The pouring process (take DP-180 system as an example)

The first pouring

The lateral pressure is supported by bottom beam anchor system during the first pouring. Embedding the formwork anchor system in the wall which will be the most important supporting parts during the next pouring.

The second pouring(the first lift)

The climbing brackets are used in the second pouring, which are fixed on the anchor system in the finished wall.

The third pouring(the second lift)

Fix the suspend platform under the whole system, the workers can remove the tensile bolt and V-climbing cone on the platform and then fill the holes left by the V-climbing cone. The later lifts are standard same as the second lift until the pouring is finished.

The first pouring The second pouring The third pouring

► The adjusting of inclination

DP-180 system can be inclined by adjusting pull-push prop. The Max. angle is 30°. The sketches are shown below:DP-180

Vertical Structure Support System

Climbing Bracket

Characteristics

High bearing capacity

The high loading capacity of the brackets allow very large scaffold units. This saves the number anchor points required as well as reducing climbing times.

Simple moving procedure by crane

Through the strong connection of formwork together with the climbing scaffold, both can be moved as a single climbing unit by crane. Thus valuable time-savings can be achieved.

Fast striking process without a crane

With the retrusive set, large formwork elements can also be retracted quickly and a minimum of effort.

Safe with work platform

The platforms have assembled firmly with bracket and will be climbing together, without scaffolding but can work safely in spite of your high location.

Vertical Structure Support System

Auto — Climbing Bracke

- ▶ The power of the auto-climbing formwork is the hydraulic system, which includes the oil cylinder and two commutators. The commutators can control the climbing of climbing rail and the bracket. The steel rail and the bracket can inter-climbing, so the whole system will climb up steadily. Cranes are not needed during the construction. It's easy to operate, highly efficient and safe. It's the best choice for the construction of high buildings and bridges.
- ▶ There are mainly two types of standard auto-climbing brackets, ACB-100 and ACB-50, the figure means the push power of cylinder with unit of KN.

Structures

ACB-100

Auto — Climbing Bracke

ACB-50

► Characteristics

Crane-independent

Crane-independent forming, striking and climbing speeds up the work procedures on the construction site and also makes them independent of each other. This means the planned sequences can be maintained along with guaranteeing high productivity levels. The crane can therefore be used for other tasks.

Hydraulic system is mainly made of two commutators, oil cylinder and power distribution system. The commutators can control the climbing of climbing rail and bracket.

Perfect load bearing anchor system

Anchor system is the most important supporting part. The system is made of five parts shown below. Thereinto, tensile bolt, V-climbing cone and washer can be taken out for reusing after the concrete pouring finished. There are two kinds of anchor systems, A & B. A is matched with single anchor shoe and B is matched with double anchor shoe.

Anchor Assembly A (Matched with single anchor shoe)

① Tensile Bolt M42	1.60kg
② Washer 78/52	0.21kg
③ V-climbing Cone M42/D20	2.78kg
④ High-strength Rod D20/L=300	0.81kg
⑤ Anchor Plate D20	0.65kg

Anchor Assembly B (Matched with double anchor shoe)

① Tensile Bolt M36	1.05kg
② Washer 65/46	0.14kg
③ V-climbing Cone M36/D20	1.77kg
④ High-strength Rod D20/L=300	0.81kg
⑤ Anchor Plate D20	0.65kg

High bearing capacity and safe

The stable working platforms are able to carry large loads, e.g. the storage of reinforcing steel for the next climbing section. Generously-sized working platforms, the well thought-out design for handling very high wind loads and the patented control function of the climbing mechanism are some of the special details contained within the comprehensive safety concept.

The system will furnish omnidirectional platform, the construction organizations don't need to set up additional operation platform. Platforms adjusted to suit the angle of inclination. The horizontal working areas thus created provide safe and comfortable conditions for reinforcement work, shuttering and striking, concreting and finishing.

The bracket will not fall to the ground until the construction is finished, the field will be saved and the impacting breakage will be reduced (especially the panel) .

The formwork can climb itself and cleaning work can be done in the same situs , the used times of tower crane will be greatly reduced.
